5.	The permanent magnet used in the SCR-584 set for the magnetron was a successful copy of the original American model. Helmuth Sprung, who worked on the development of magnet steels at Fryazino, was in contact with a development institute for magnet steels in Moscow. He stated that the Moscow institute was obsolete. Ferrites were produced in a special institute in Moscow, but it was not possible for Institute 160 to receive any materials from there. In 1950, a sudden improvement in the quality of the electric parts supplied to the institute.
6.	Work on the development of travelling wave tubes had got into an impasse at Institute 160. These tubes were allegedly also developed at the MVD Institute for Direction-Finding Technique. This institute was subordinated to the 8th or 9th Chief Directorate of the Ministry of Internal Affairs. This Chief Directorate was also in charge of the development of atomic weapons and of radio intercept service.
7.	Major Cherepnin (fnu) was the only Soviet engineer who would be capable of initiating the production of acceleration-proof tubes. 3 . 25X1 It was doubted that the Soviet output of such tubes met their requirements.
8.	Production quotas fixed for workers at the tube plant were rather flexible and not stringently applied. The production of tubes had been given priority only recently, and the plant management greatly depended on the good will of the personnel.
9.	The Radiation Laboratory Series, a 28-volume edition published by the Massachusetts Institute of Technology, was copied and published in an edition of 5,000 to 10,000 copies each. Volumes 6 and 7 on magnetrons and klystrons were available rather soon, while the 5,000-copy edition of Volume 25 on the theory of servo mechanisms was soon exhausted.
10.	The Soviet scientific literature was partly very good. However, since authors of scientific books were paid badly, the Soviet engineers showed little; interest in writing books. Translations paid much better. The Soviet printing firms were overloaded with secret literature to be printed. When, in 1950-1951, a book was to be printed, the Radiotekhnika Publishing Firm, which was comparable to the German Springe Publishing Firm, refused to print the book for this reason. The Radiotekhnika Magazine was not permitted to publish studies on new Soviet developments.
11.	25X1
	one study on an electronic recorder (Elektronenbahn) and a study on ultra shortwave transmitter tubes
12.	the shortage of technical experts was compensated for by the excellent Soviet industrial organization, especially in the field of tube production. With personnel of average qualifications, the Soviets accomplished much. The production methods of the U.S. had been studied very carefully and evaluated for use by Soviet plants. Popov (fnu), the chief organizer of the Ministry of the Communications Equipment Industry, was a very successful organizer. By his personal initiative and by cutting down red tape Popov was successful in synchronizing the work methods of the individual plants and institutes, making experiences available to all of them, and developing most efficient work procedures. Major difficulties were caused by human weaknesses, which particularly hampered the cooperation of the development and production branches. Popov repeatedly visited Institute 160 for two or three weeks at a time.
13.	In February 1947, Vice Admiral Berg stated that there were no young high-frequency engineers to graduate from the institutes of technology for the next years because the classes of those years had been killed during the war. An extensive

	available after 1950. and 1949, only individual young e 100 graduates arrived at Easter 1	n started, and many young engineers were to be While, in 1948 ngineers were assigned to Institute 160, about 950 and about 400 young engineers at Easter 1951. neers. About 90 percent of the personnel at o served as engineers.	25X1					
14.	Radio amateurs were widely patronized by Admiral Berg, who had even published literature for amateurs. Among them were magazines which were edited perfectly and printed in an edition of 50,000 copies. The Radio Magazine was also very good at Institute 160 no one cared when amateurs took parts from the institute supplies.							
	List of Tube Plants in the USSR							
15.	Special technical tubes, such as postal tubes (Postroehren) were not manufactured. In Fryazino, only tubes with glass balks were manufactured. In early 1952, the initial steps for the production of reliable tubes were observed in Fryazino. Other tube plants were:							
	Plant	Production	,					
	Institute 160 in Moscow/ Fryazino	Magnetrons, klystron tubes (glass types), television tubes, and high power transmitter tubes	•					
	Electrical Factory, Moscow	Television tubes						
	Svetlana	Rlystron tubes with metal bulbs, including type 723.	*					
	Novosibirsk	Metal ceramic tubes and high power transmitter tubes with external anodes.	٠.					
	Tashkent	High power transmitter tubes with glass bulbs.	١٠,					
	Saratov	Magnetrons and klystrons only for the 3-cm Meddo set. It was unknown whather the other tubes required for this set were also produced at this plant.						
	MGB Institute, Moscow	The plant is engaged in development only, probably of 0.8-cm tubes.						
	Radar Institute 108, Moscow	No production of tubes. It is doubted whether the plant is equipped with a tube laboratory.	,					
	Kalinin	Kalinin was mentioned in a request to investigate the production facilities for sub-miniature tubes forwarded to Fryazino in 1950.						
	Comments:		25X1					
,	1. The Pauke SRT was alblind aim for fighter aircraft and spec	ning device developed by the Telefunken firm tial planes of the Luftwaffe.	,					
	Pauke A operated at wave rang with about 6 arrested	$_{\rm ce} \sum = 6173$ cm I positions (Raststellen)	•					
	Pauke S operated at wave rang	ge <u> </u>	25X1					
	2. Prior to November 1948, Major bubes to the Oberspreewerk in	Cherepnin was assigned as Soviet expert for Berlin-Oberschoeneweide.						
	3. Comment: technical difficulties st. Tul	Cherepnin was reported to be working on pe Plant No., 617 at Novosibirsk.	25X1
